# **MNCrashMonitor**

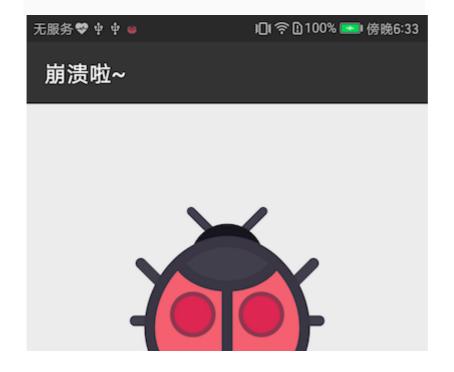

MNCrashMonitor 监听程序崩溃日志,直接页面展示崩溃日志列表,调试方便,测试人员可以随时给程序猿查看日志详情,可以动态添加日志内容,手机直接查看日志内容可以分享,复制,生成长截图。

JitPack V1.0.7

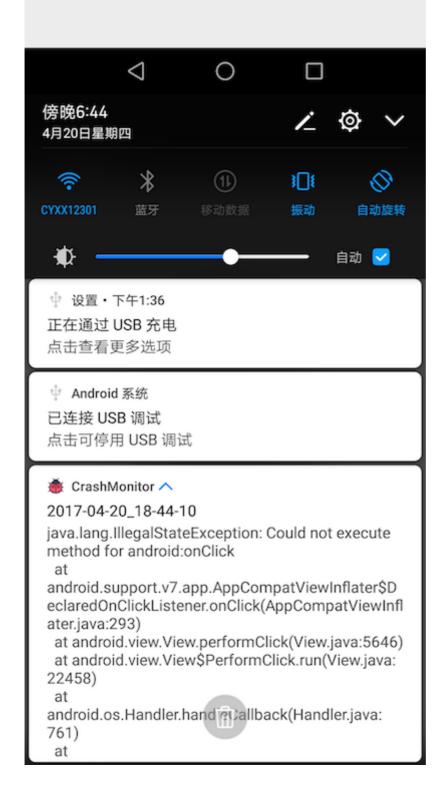

## 截图

## 如何添加

### Gradle添加:

## 1.在Project的build.gradle中添加仓库地址

```
allprojects {
    repositories {
        ...
        maven { url "https://jitpack.io" }
    }
}
```

#### 2.在app目录下的build.gradle中添加依赖

```
dependencies {
    compile 'com.github.maning0303:MNCrashMonitor:V1.0.7'
}
```

## 使用方法:

## 1.Application 的 onCreate()方法 初始化:

```
/**
 * 初始化日志系统
 * context: 上下文
 * isDebug: 是不是Debug模式,true:崩溃后显示自定义崩溃页面;false:关闭应用,
不跳转奔溃页面(默认)
 * CrashCallBack: 回调执行
 */
MCrashMonitor.init(this, true, new MCrashCallBack() {
    @Override
    public void onCrash(File file) {
        //可以在这里保存标识,下次再次进入把日志发送给服务器
        Log.i(TAG, "CrashMonitor回调:" + file.getAbsolutePath());
    }
});
```

# 2.动态设置其它额外信息到日志中 (如用户手机号, wifi状态等信息):

```
String extraInfo = "用户手机号码: 16666666666" +
"\n用户网络环境: wifi";
MCrashMonitor.setCrashLogExtraInfo(extraInfo);
```

## 3.其它相关方法介绍:

```
/**

* Created by maning on 2017/4/20.

* 主类

*/
public class MCrashMonitor {

/**

* 初始化

*

* @param context 上下文

*/
public static void init(Context context) {

MCrashHandler crashHandler = MCrashHandler.getInstance();
 crashHandler.init(context);
}

/**

* 初始化

*
```

```
* @param context 上下文
            * @param isDebug 是否处于debug状态
           public static void init(Context context, boolean isDebug) {
               MCrashHandler crashHandler = MCrashHandler.getInstance();
               crashHandler.init(context, isDebug);
           }
           /**
            * 初始化
            * @param context 上下文
            * @param crashCallBacks 回调
           public static void init(Context context, MCrashCallBack
crashCallBacks) {
               MCrashHandler crashHandler = MCrashHandler.getInstance();
               crashHandler.init(context, crashCallBacks);
           }
           /**
            * 初始化
            * @param context
                                  上下文
            * @param isDebug 是否处于debug状态
            * @param crashCallBacks 回调
            */
           public static void init(Context context, boolean isDebug,
MCrashCallBack crashCallBacks) {
               MCrashHandler crashHandler = MCrashHandler.getInstance();
               crashHandler.init(context, isDebug, crashCallBacks);
           }
           /**
            * 日志列表页面
            * @param context
           public static void startCrashListPage(Context context) {
               Intent intent = new Intent(context.getApplicationContext(),
CrashListActivity.class);
               intent.addFlags(Intent.FLAG_ACTIVITY_NEW_TASK);
               context.getApplicationContext().startActivity(intent);
           }
           /**
            * 打开奔溃展示页面
            * @param context
           public static void startCrashShowPage(Context context) {
               Intent intent = new Intent(context.getApplicationContext(),
CrashShowActivity.class);
               intent.addFlags(Intent.FLAG_ACTIVITY_NEW_TASK);
               context.getApplicationContext().startActivity(intent);
           }
           /**
```

#### 文件的位置:

```
/Android/data/包名/cache/crashLogs/
或者
/data/data/包名/cache/crashLogs/
```

## 生成截图的位置:

```
Environment.getExternalStorageDirectory() + "/crash_pic_" +
System.currentTimeMillis() + ".jpg"
```

### 注意:

当应用已启动就崩溃的无法打开页面,直接看通知或者去文件夹里面查看:
